# Homework Review

What was different about setting up Normal model compared to the Binomial?

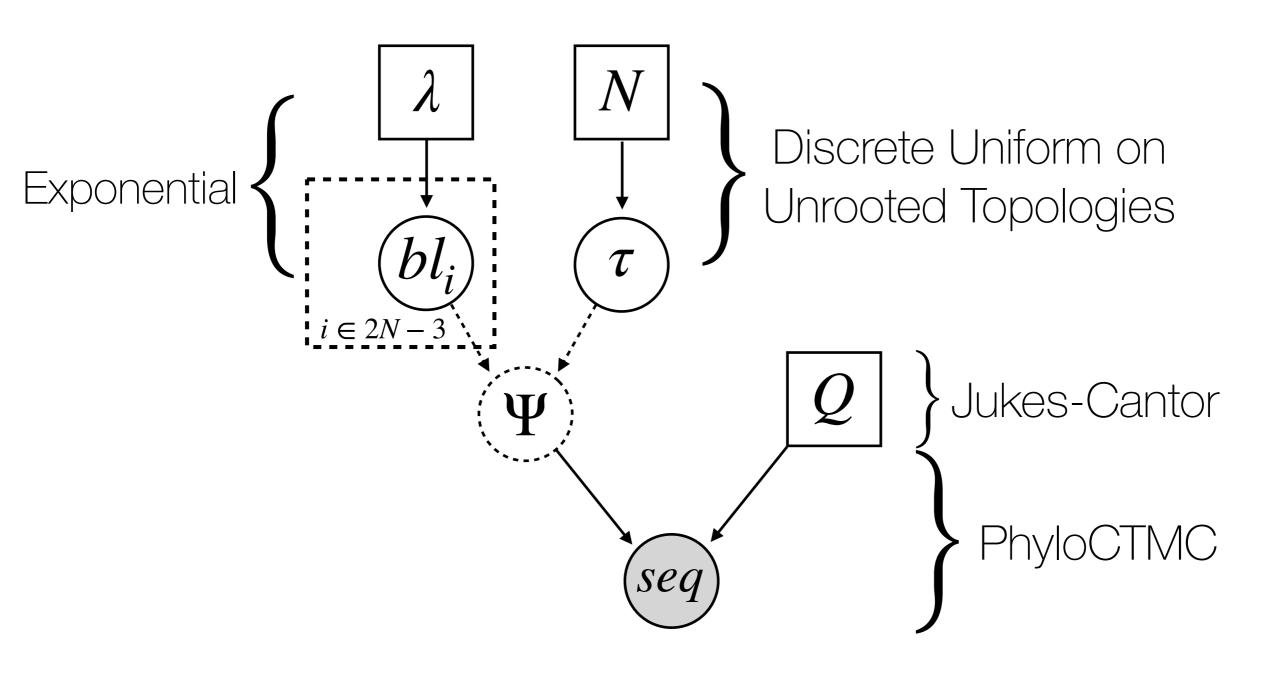

Did you run into any difficulties?

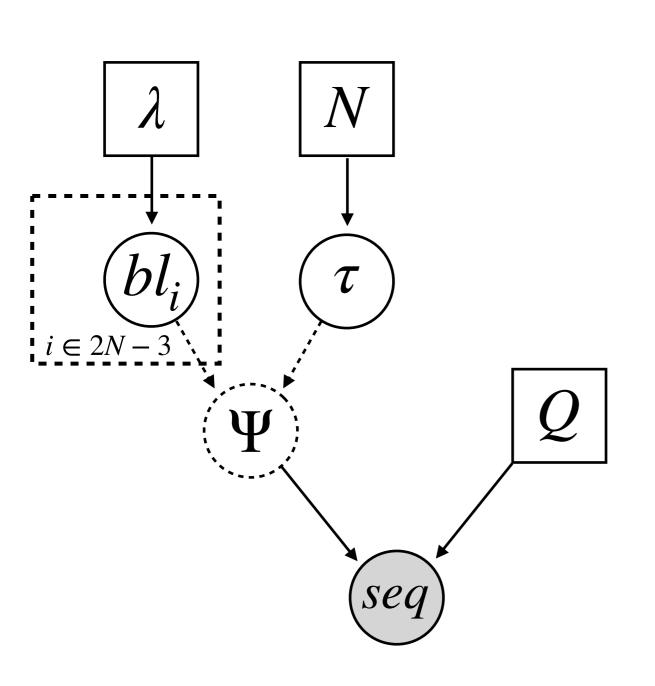

How did the output look? Was convergence good?

Did you run multiple replicates?

What effect, if any, did changing your prior have?

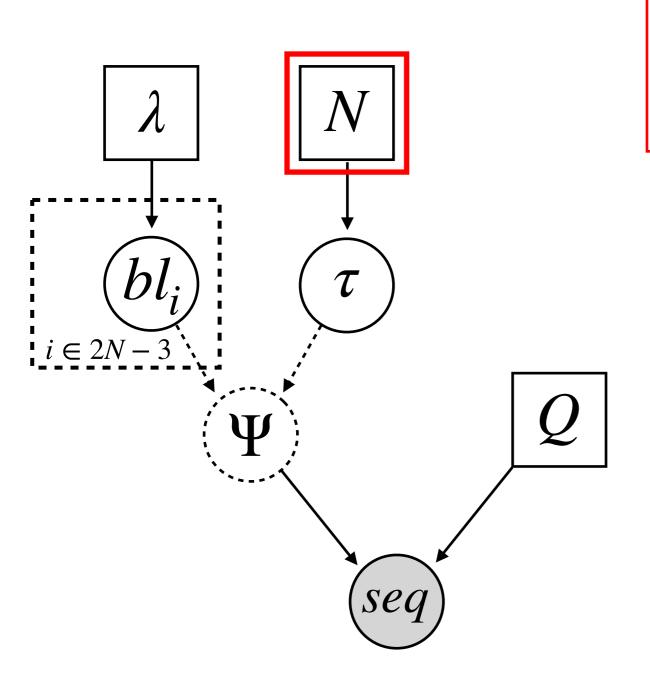

# Phylogenetic Graphical Models

```

# Dirichlet Distribution

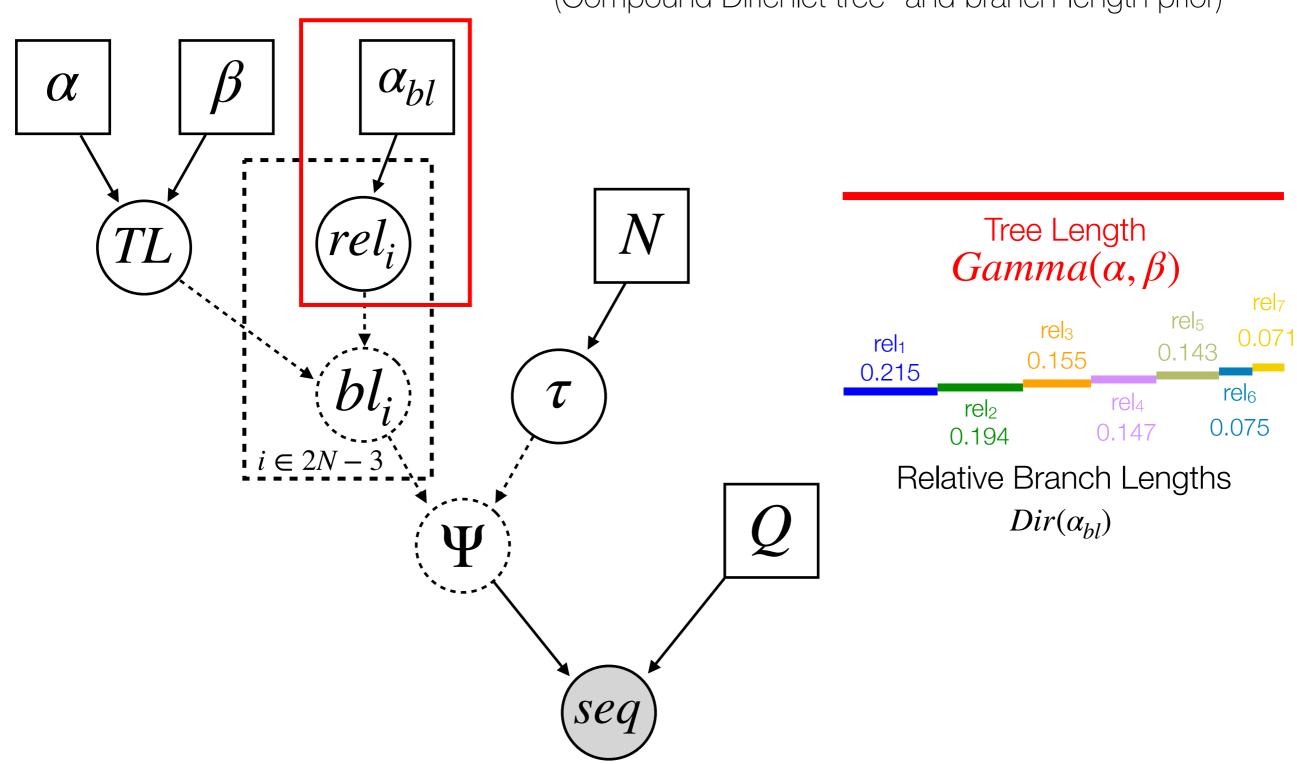

The Dirichlet distribution is a multivariate generalization of the Beta distribution. It describes the joint distribution of a set of parameters, each of which is bounded between 0 and 1, **and whose sum is 1**.

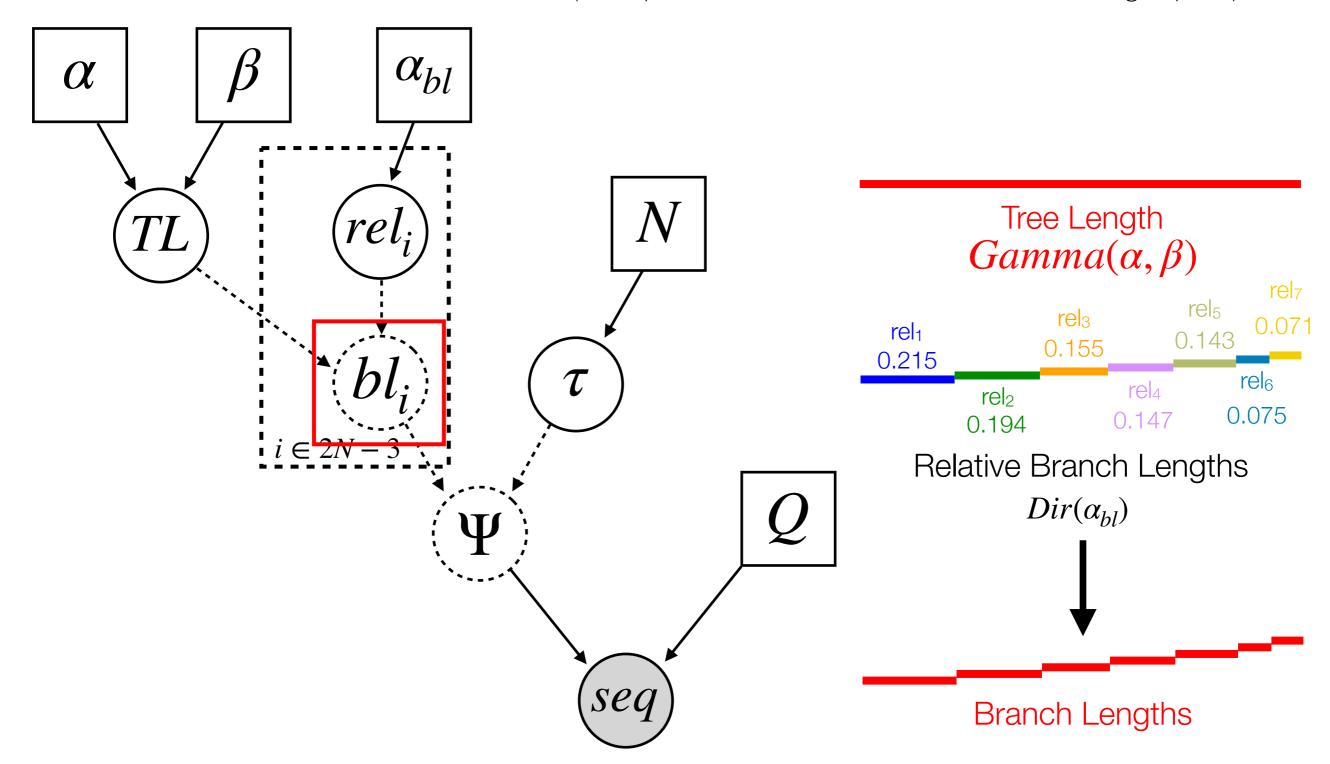

(Compound Dirichlet tree- and branch-length prior)

(Compound Dirichlet tree- and branch-length prior)

(Compound Dirichlet tree- and branch-length prior)

(Compound Dirichlet tree- and branch-length prior)

```
data = readDiscreteCharacterData("myData.nex")
taxa <- data.taxa()
n_taxa <- data.ntaxa()
n_branches <- 2 * n_taxa - 3
```

```
alpha <- 2
beta <- 4

TL ~ dnGamma(alpha,beta)

alpha_bl <- 1.0

rel_branch_lengths ~ dnDirichlet( rep(alpha_bl,n_branches) )

br_lens := rel_branch_lengths * TL
```

# Compound Dirichlet

```
topology ~ dnUniformTopology(taxa)

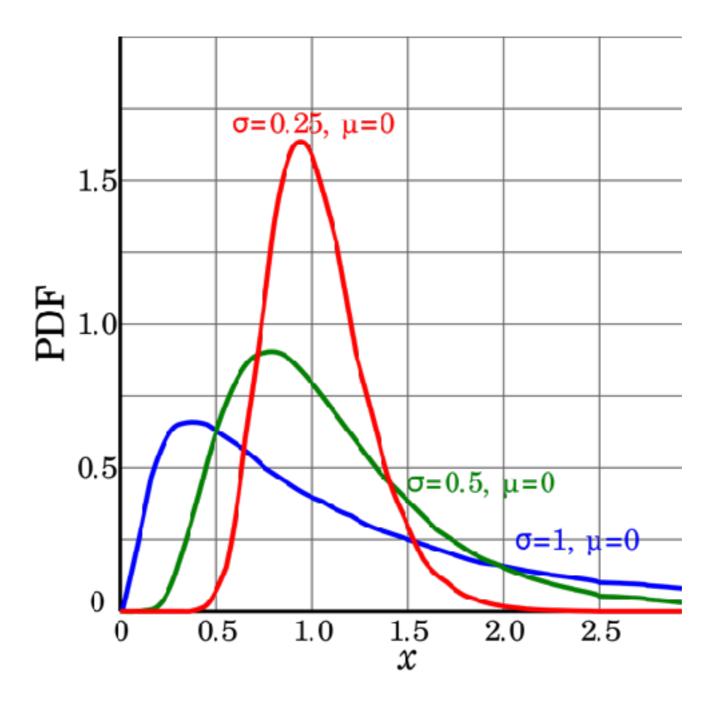

Q <- fnJC(4)

psi := treeAssembly(topology, br_lens)

seq ~ dnPhyloCTMC(tree=psi,Q=Q,type="DNA")

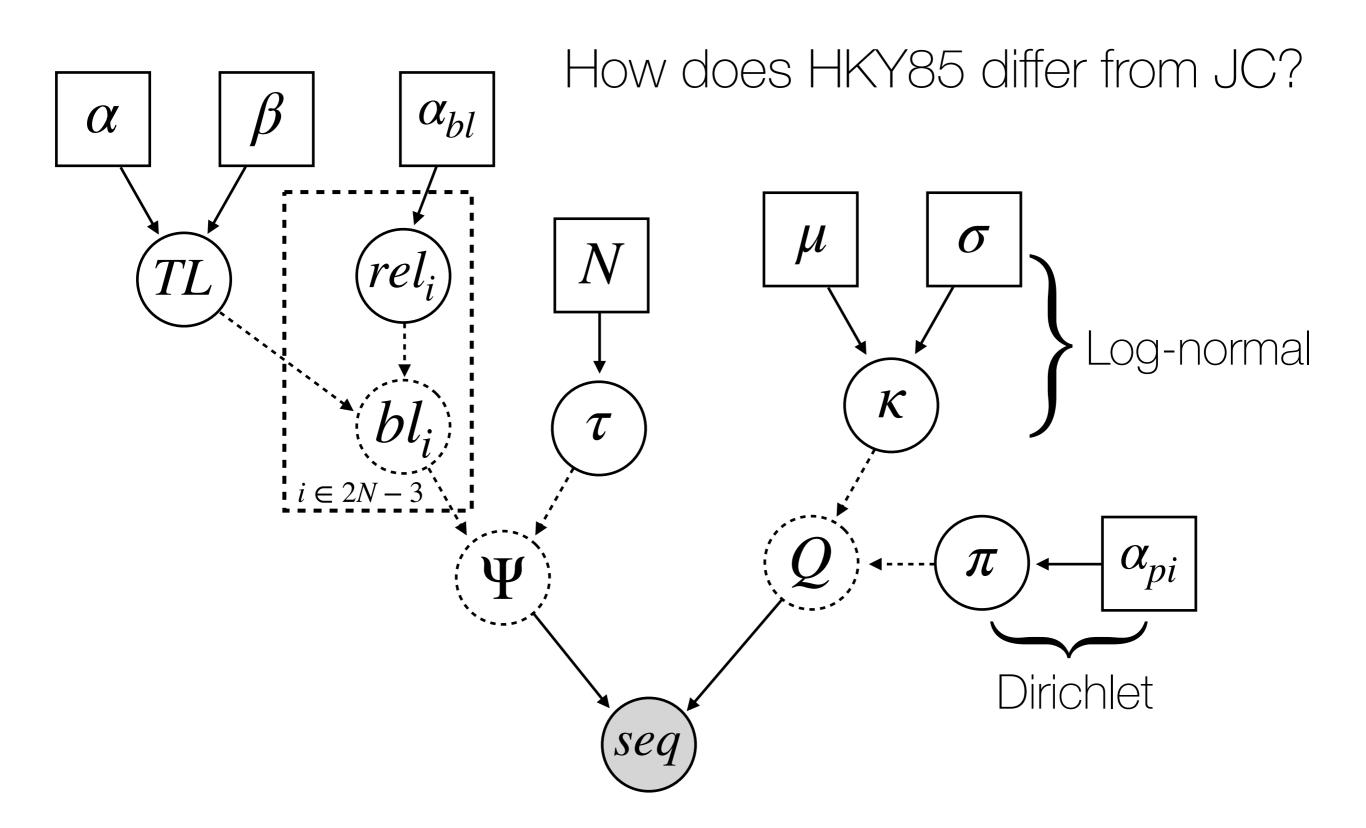

seq.clamp(data)
```

# Log-Normal Distribution

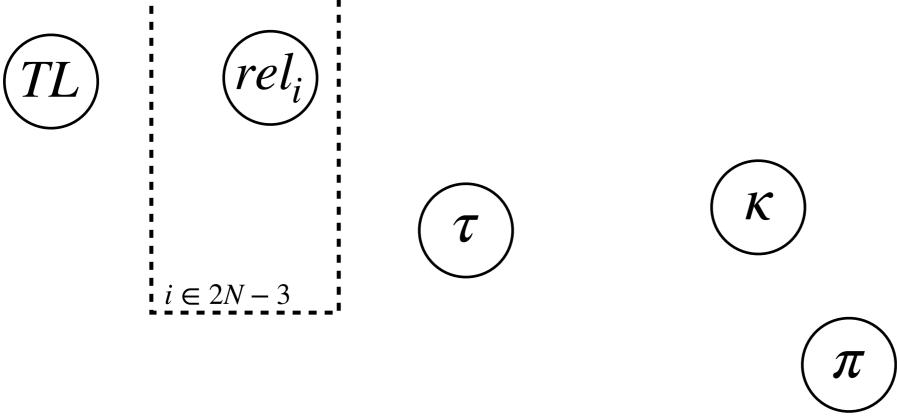

In probability theory, a log-normal (or lognormal) distribution is a continuous probability distribution of a random variable whose logarithm is normally distributed.

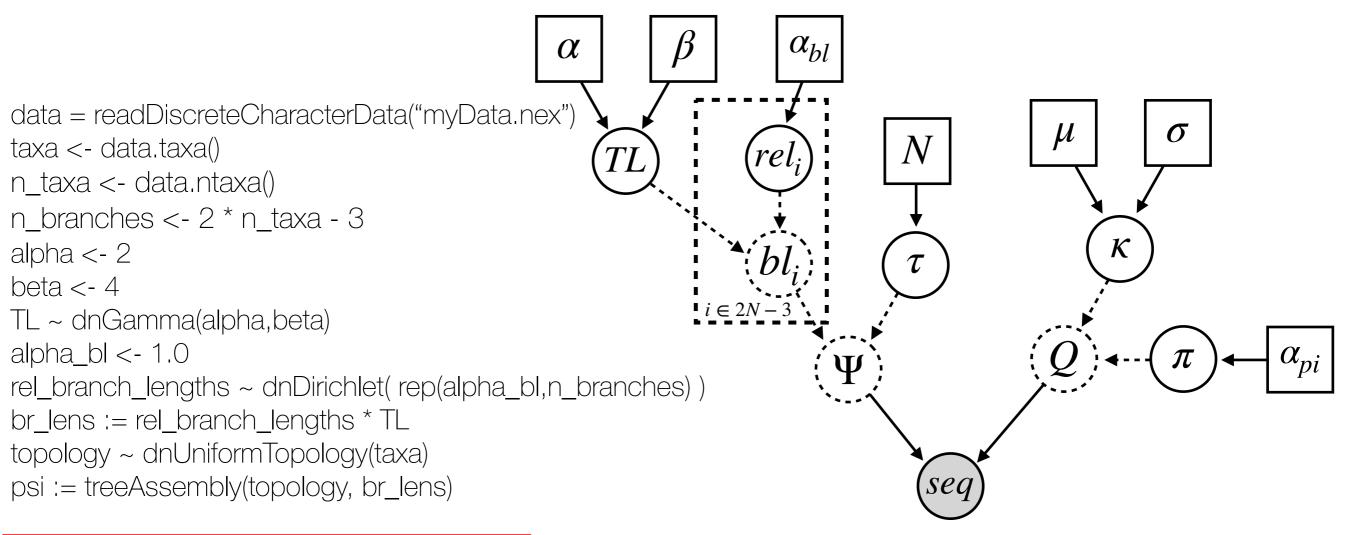

## HKY85

### HKY85

Remember, these are the parameters whose values we're inferring (learning about from the data).

mu <- 0 sigma <- 1 kappa ~ dnLognormal(mu,sigma)

pi ~ dnDirichlet( rep(alpha\_pi,4) )

Q <- fnHKY(kappa,pi)

alpha\_pi <- 1.0

HKY85

seq ~ dnPhyloCTMC(tree=psi,Q=Q,type="DNA")
seq.clamp(data)

# Things to Remember

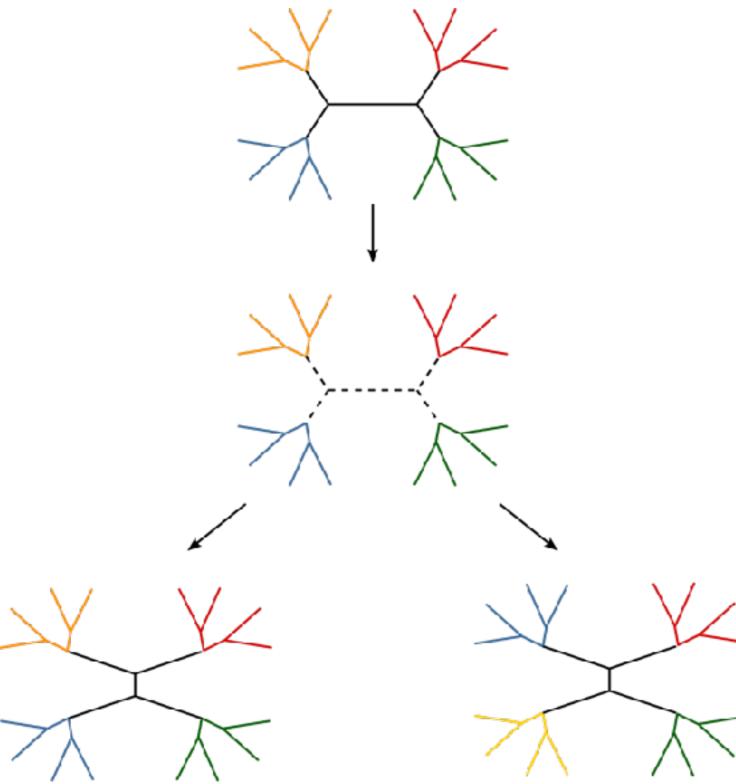

As we add more stochastic nodes, remember to assign moves to all of them!

Vectors modeled with a Dirichlet need to have a joint proposal mechanism, since they need to sum to 1. Here are a couple:

mvBetaSimplex mvDirichletSimplex

You'll often want to run analyses on the same dataset with multiple models. Start by saving your simplest model into a text file (.rev). Then, copy and paste the code into a file for the next model and adjust as necessary. Keep going as you work your way to more complex models.

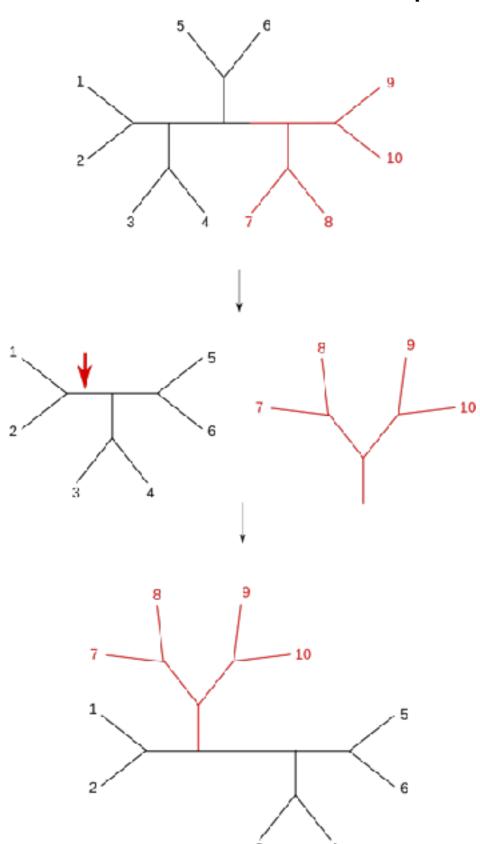

# Topology Moves

Nearest-Neighbor Interchange (NNI)

The most minor topological move.

# Topology Moves

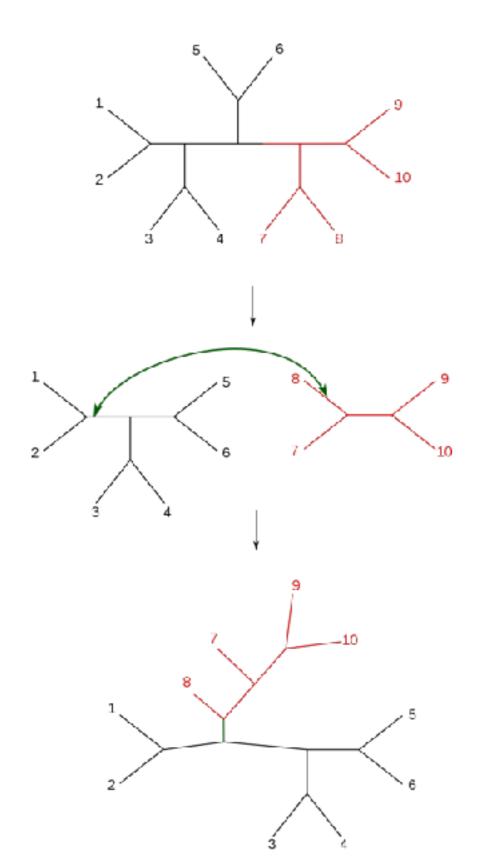

Subtree Prune and Regraft (SPR)

Intermediate topological move.

Often a good balance between exploring new tree space without disrupting things too much.

# Topology Moves

Tree Bisection and Reconnection (TBR)

Disruptive topological move.

# Summarizing Phylogenetic MCMC Output

For scalar (numerical) parameters, we often report:

Mean

Median

95% Highest Posterior Density Interval

95% Credibility Interval (often similar to HPD)

# Summarizing Phylogenetic MCMC Output

For trees, we often report:

Maximum A Posteriori (MAP) Tree ("Best" Tree)

#### Majority-Rule Consensus Tree

(Formed from all bipartitions with posterior > 0.5)

#### Greedy Consensus Tree

(Formed by ranking bipartitions and adding them until tree is fully resolved)

#### Maximum Clade Credibility Tree

(Sampled tree whose product of bipartition probabilities is greatest)

#### 95% Credible Set

(Set of most probable trees whose total probability is  $\geq 95\%$ )

# RevBayes CTMC Tutorial

https://revbayes.github.io/tutorials/ctmc/

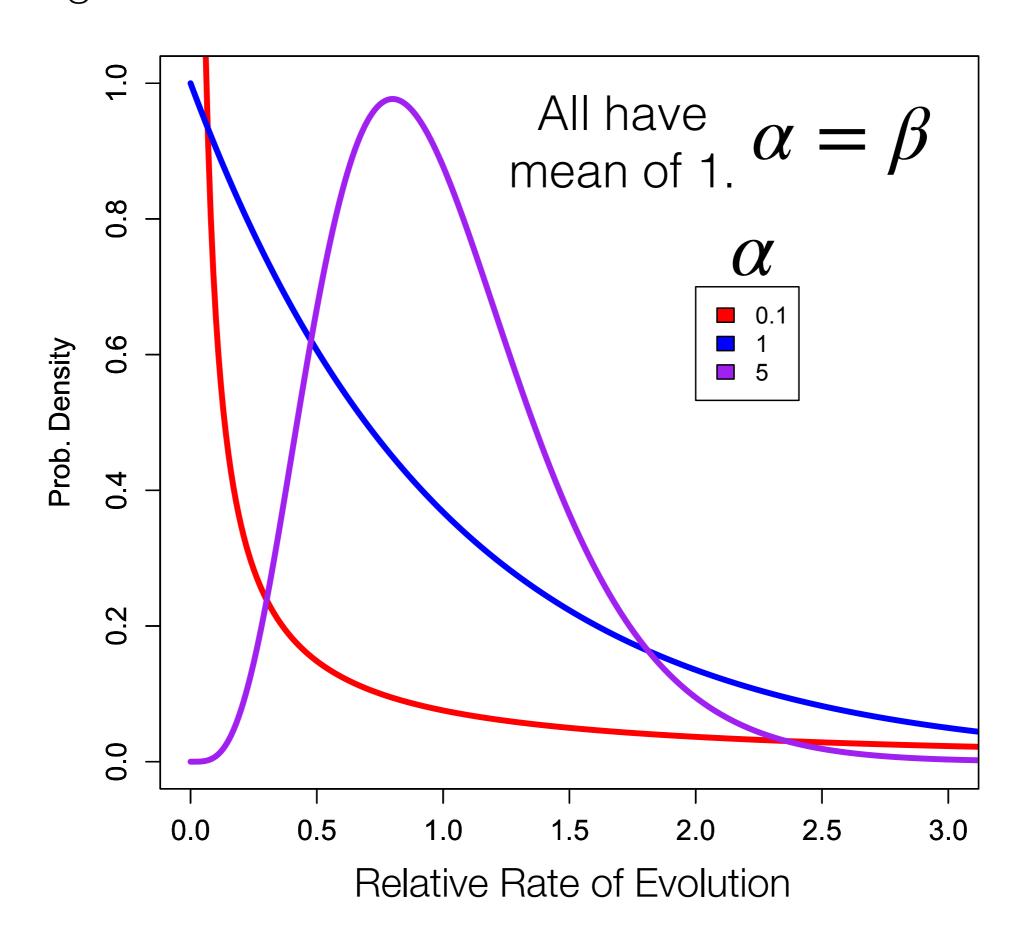

Look at Table 1 in the tutorial above.

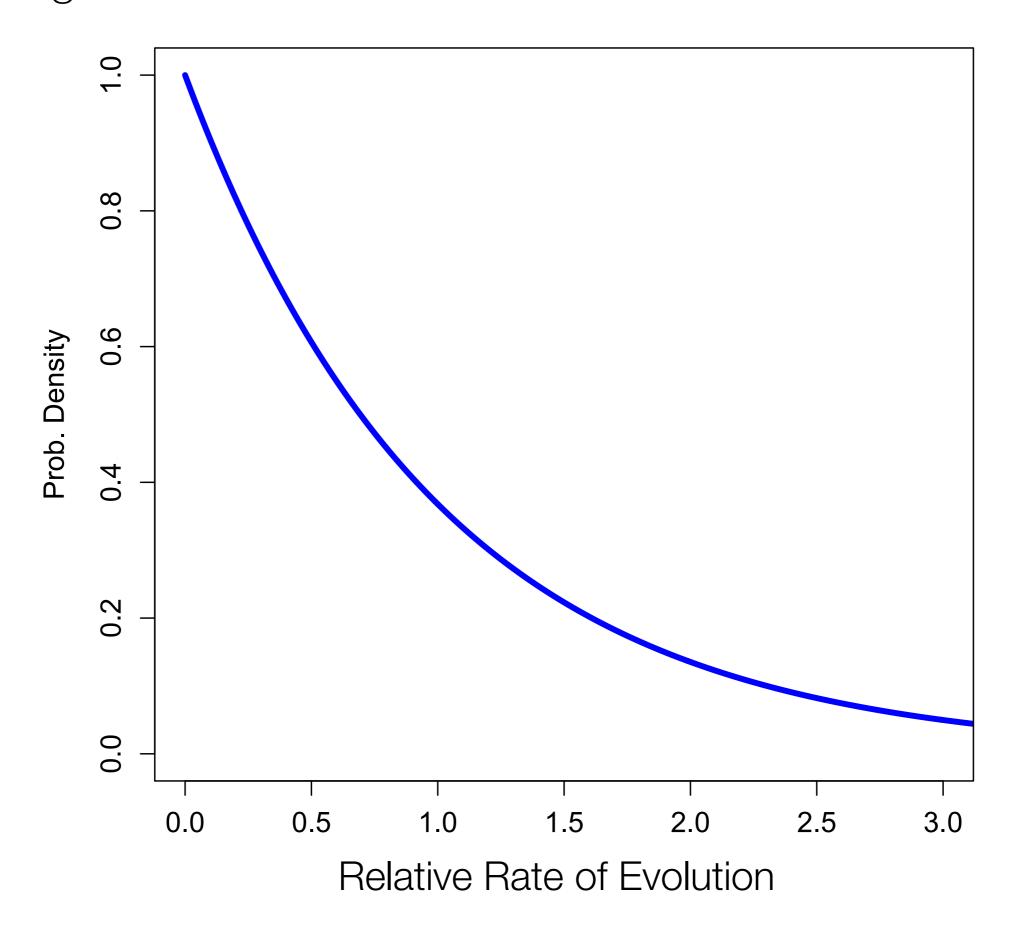

Using the model descriptions in the table, use the same principles we've been practicing to set up each of these models in RevBayes.

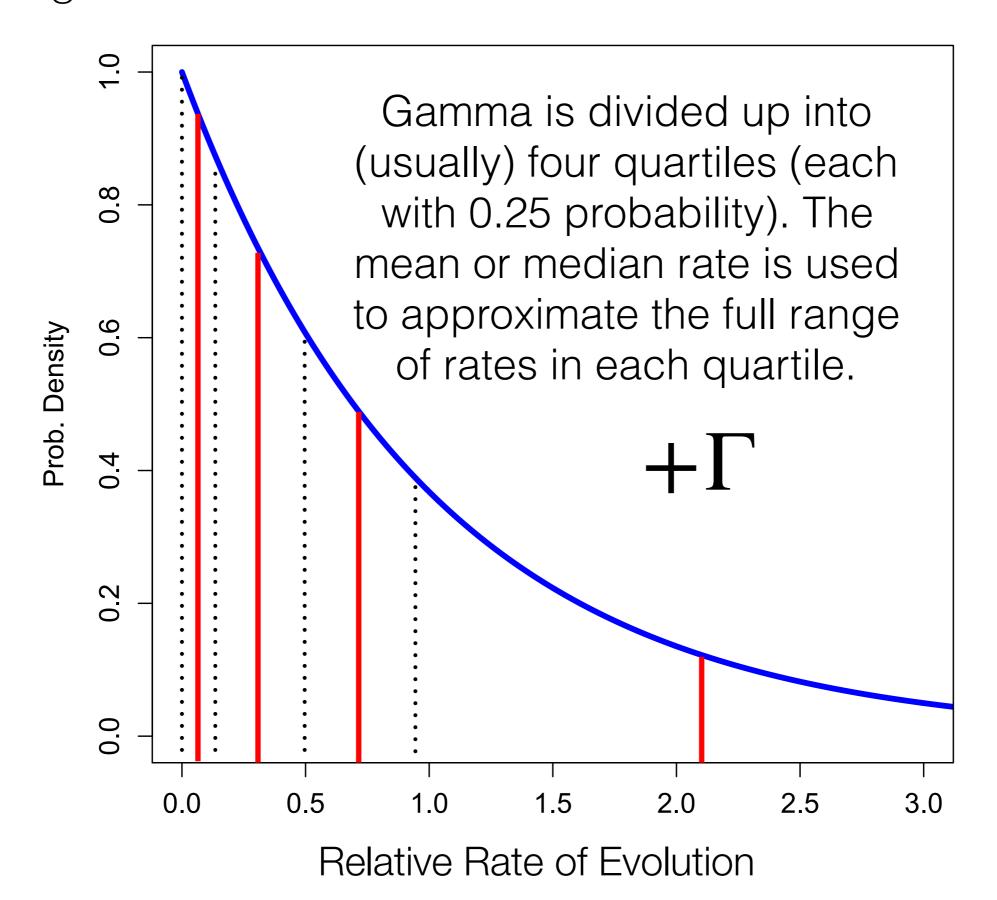

Fill out Table 2 for all the models that don't include +Gamma or +I. (we'll get to those shortly)

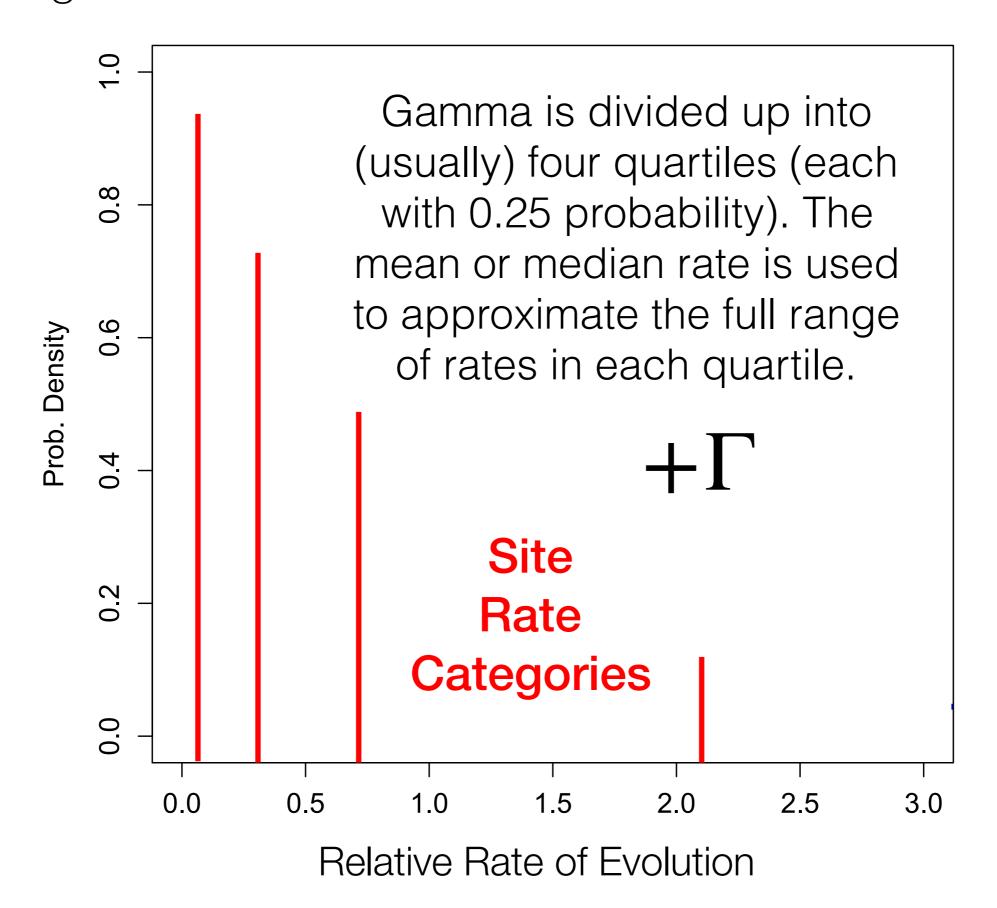

Keep your .rev files and inferred clade probabilities. Before next week, once you've worked through all the models, submit your .rev files and inferred probabilities to the homework folder on GitHub.

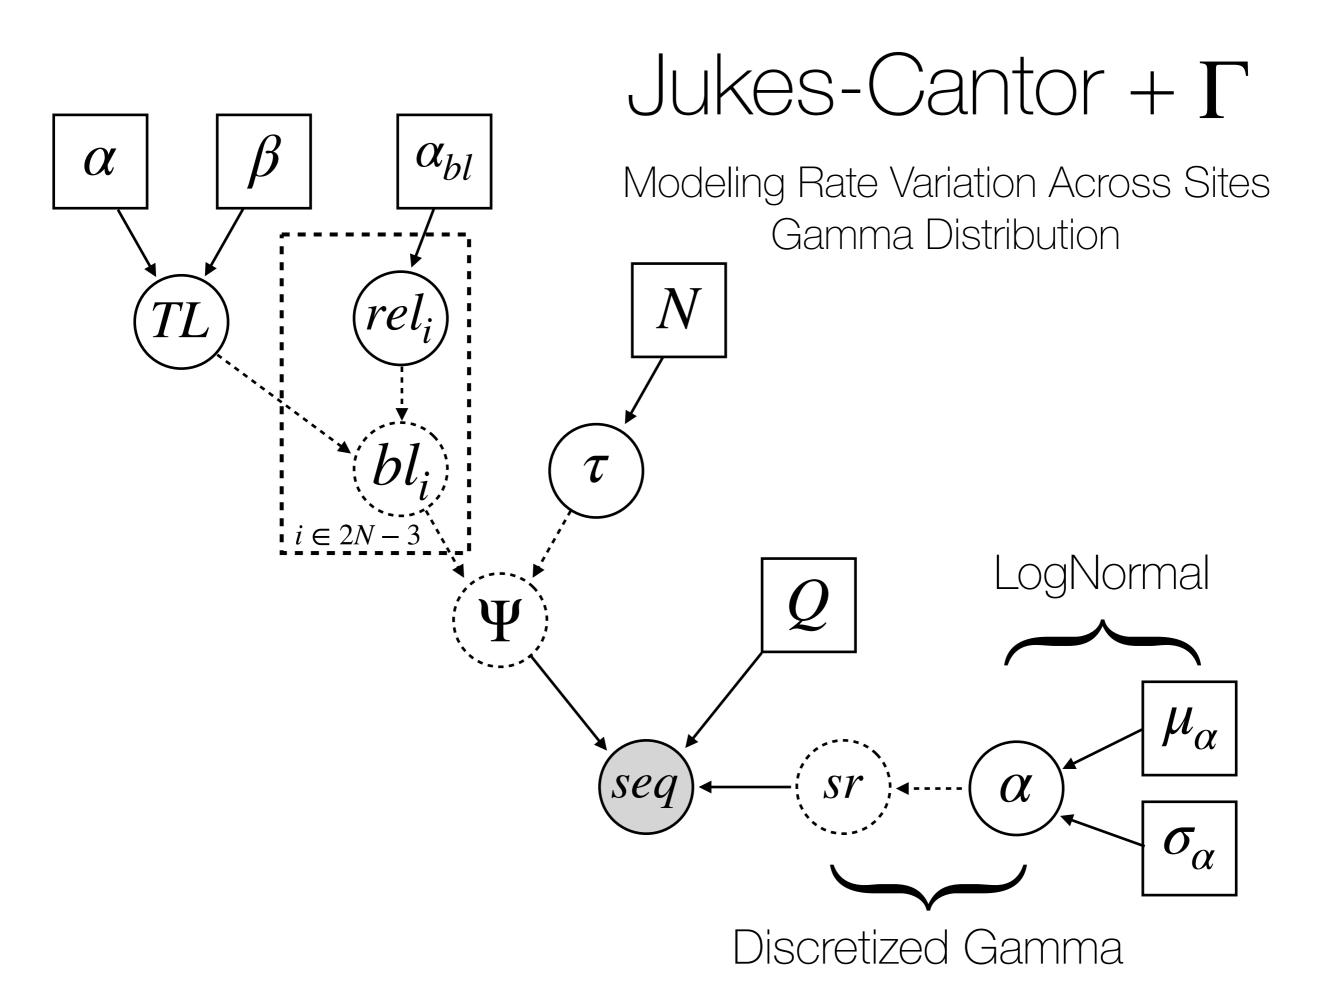

# Rate Variation Across Sites (RAS)

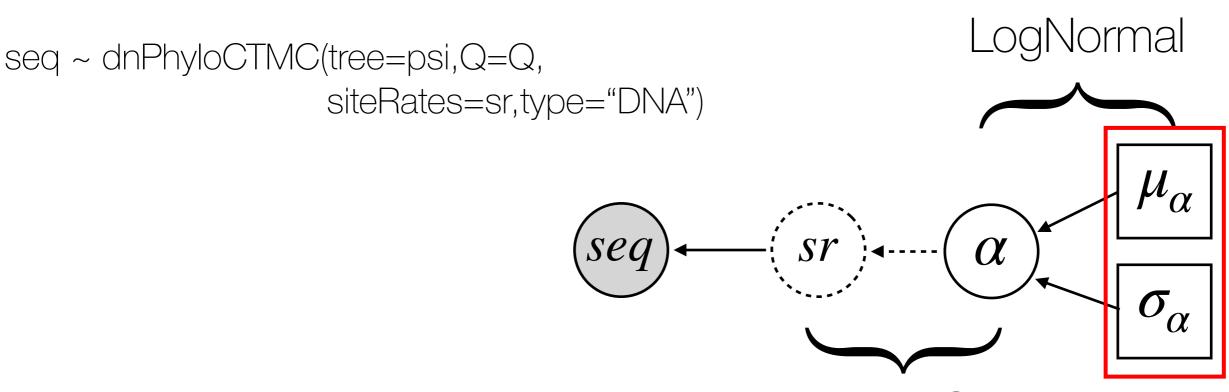

# Jukes-Cantor $+\Gamma$

Modeling Rate Variation Across Sites
Gamma Distribution

mu\_a <- ln(5.0) sigma\_a <- 0.587405

alpha ~ dnLognormal( mu\_a, sigma\_a )

sr := fnDiscretizeGamma( alpha, alpha, 4, false )

Discretized Gamma

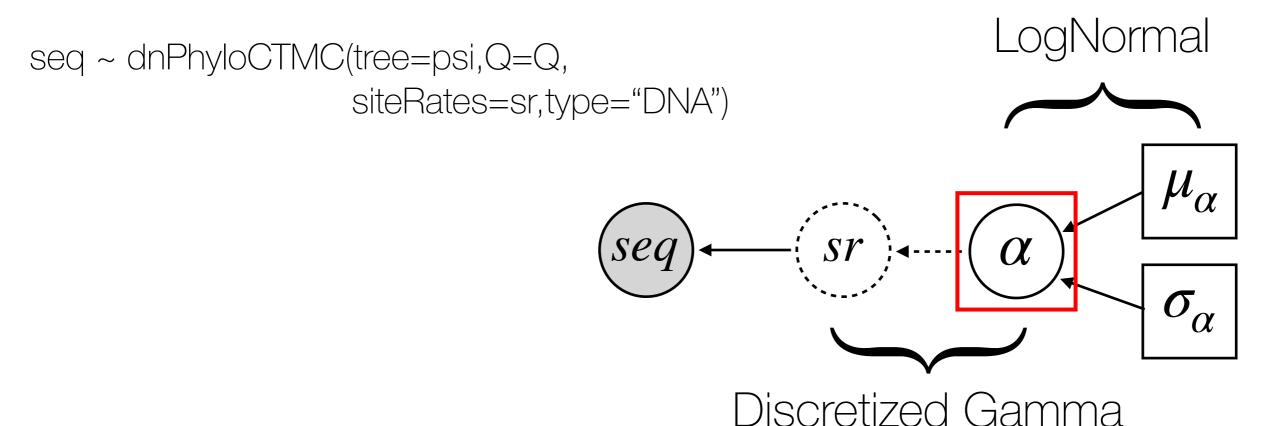

# Jukes-Cantor $+\Gamma$

Modeling Rate Variation Across Sites
Gamma Distribution

mu\_a <- ln(5.0) sigma\_a <- 0.587405

alpha ~ dnLognormal( mu\_a, sigma\_a )

sr := fnDiscretizeGamma( alpha, alpha, 4, false )

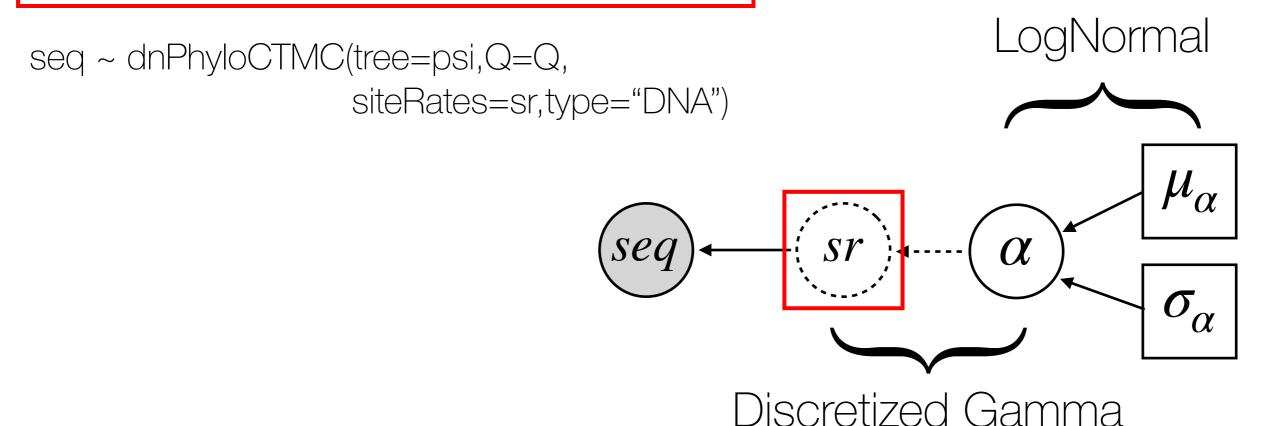

# Jukes-Cantor $+\Gamma$

Modeling Rate Variation Across Sites
Gamma Distribution

mu\_a <- ln(5.0) sigma\_a <- 0.587405

alpha ~ dnLognormal( mu\_a, sigma\_a )

sr := fnDiscretizeGamma( alpha, alpha, 4, false )

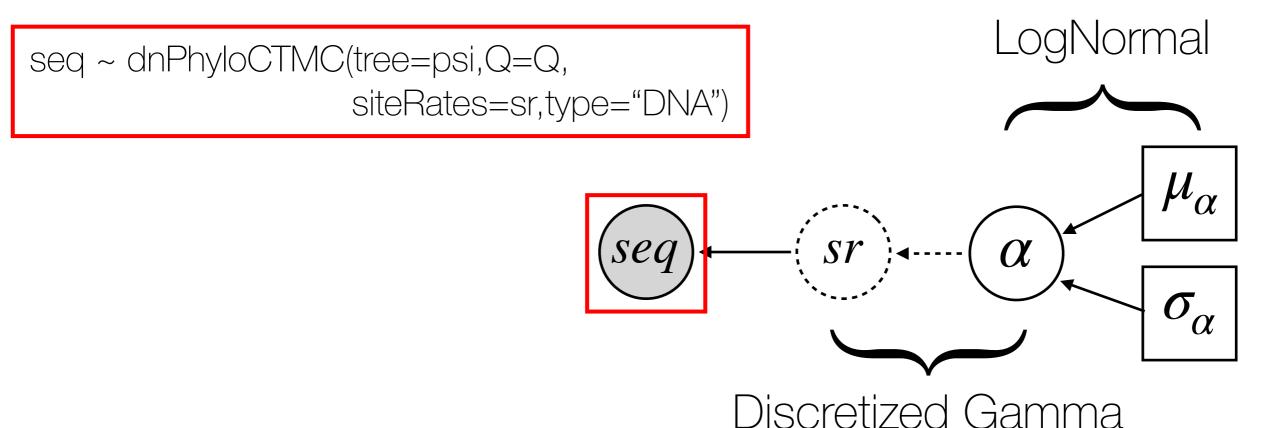

## Jukes-Cantor $+\Gamma$

Modeling Rate Variation Across Sites
Gamma Distribution

mu\_a <- ln(5.0) sigma\_a <- 0.587405

alpha ~ dnLognormal( mu\_a, sigma\_a )

sr := fnDiscretizeGamma( alpha, alpha, 4, false )

Modeling Rate Variation Across Sites
Gamma Distribution

LogNormal

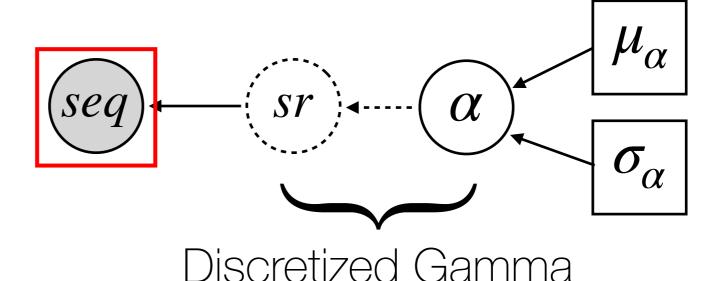

```
mu_a <- ln(5.0)
sigma_a <- 0.587405
```

alpha ~ dnLognormal( mu\_a, sigma\_a )

sr := fnDiscretizeGamma( alpha, alpha, 4, false )

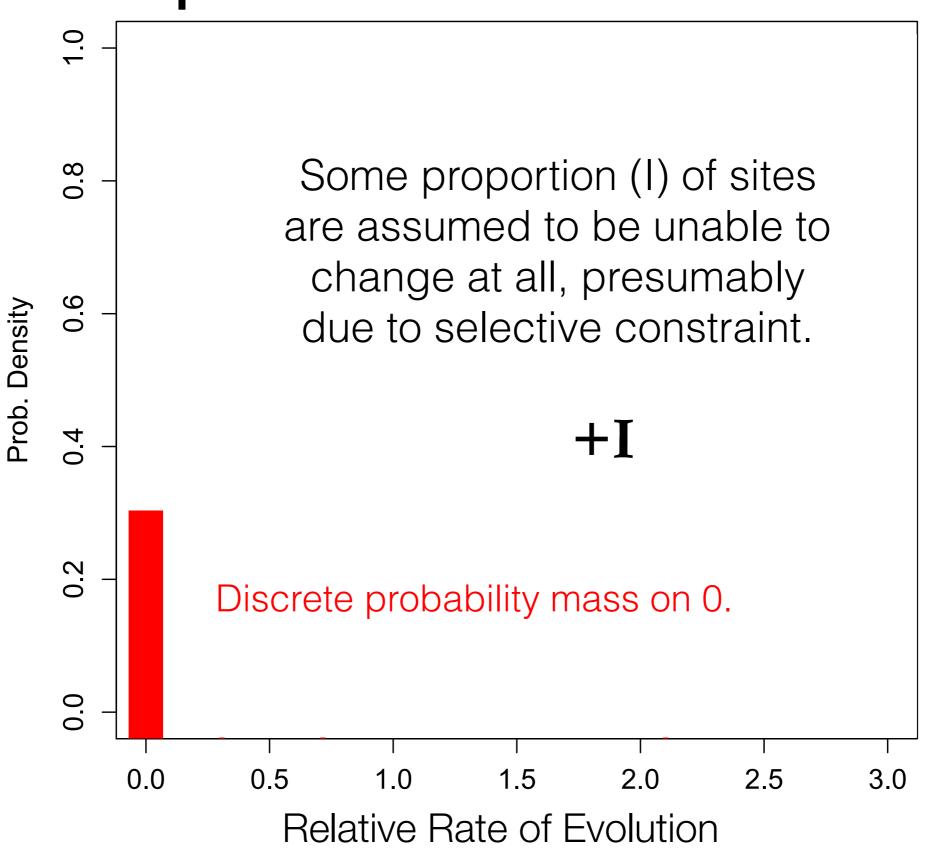

seq ~ dnPhyloCTMC(tree=psi,Q=Q, siteRates=sr,type="DNA")

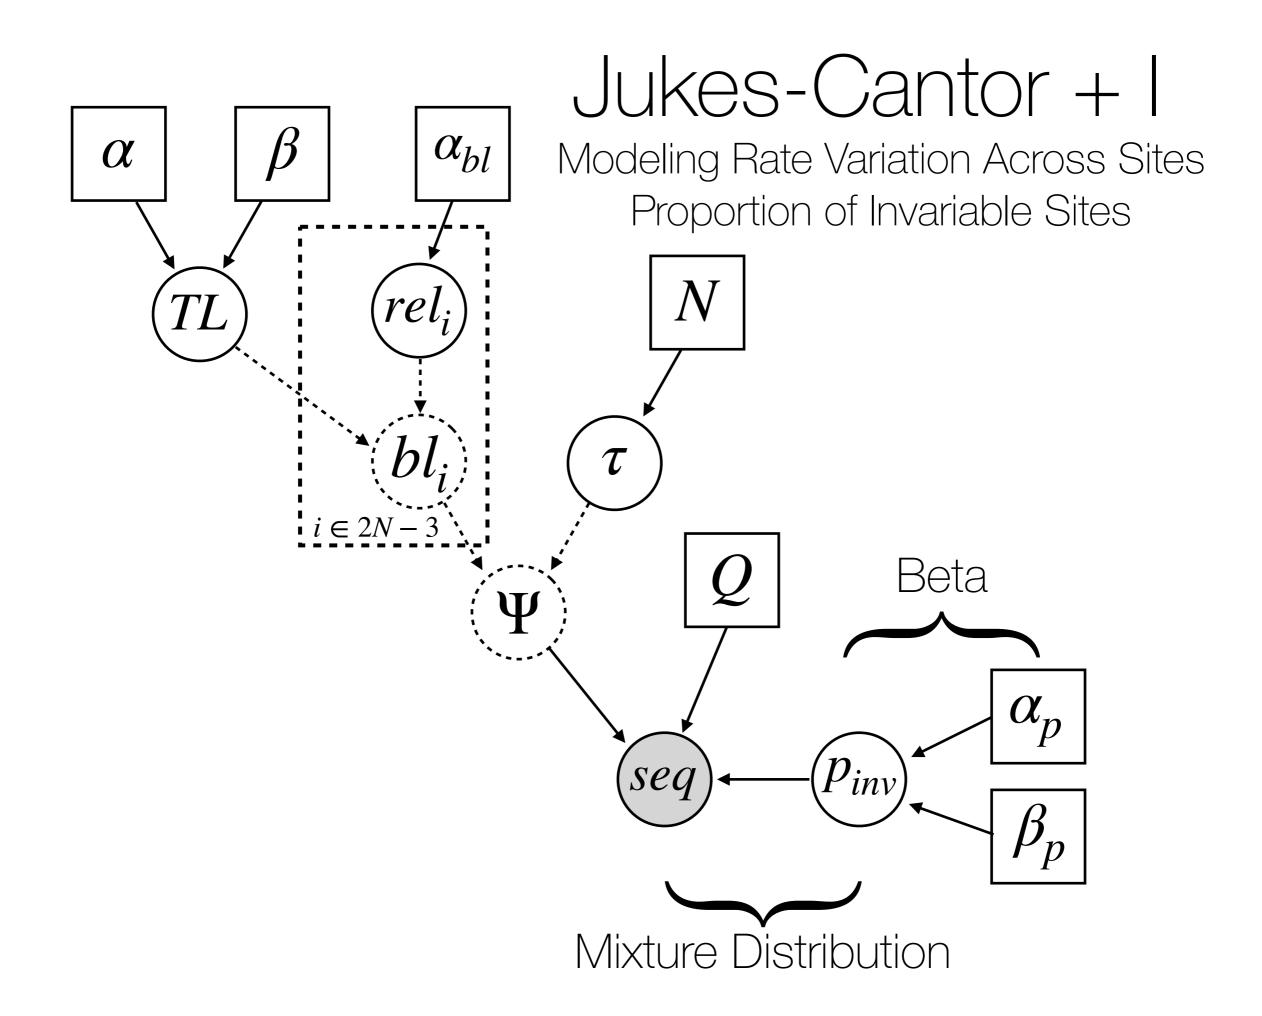

Can add  $+\Gamma$  to any "standard" model of sequence evolution.

#### Modeling Rate Variation Across Sites

#### Proportion of Invariable Sites

Modeling Rate Variation Across Sites
Proportion of Invariable Sites

alpha\_p <- 1.0 beta\_p <- 1.0

p\_inv ~ dnBeta( alpha\_p, beta\_p )

Modeling Rate Variation Across Sites
Proportion of Invariable Sites

alpha\_p <- 1.0 beta\_p <- 1.0

p\_inv ~ dnBeta( alpha\_p, beta\_p )

Modeling Rate Variation Across Sites
Proportion of Invariable Sites

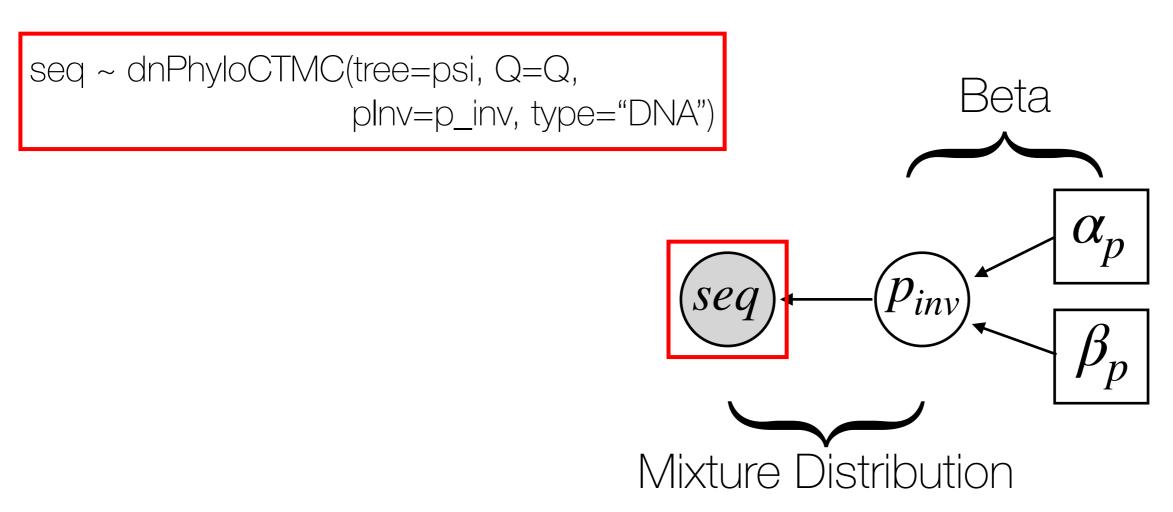

alpha\_p <- 1.0 beta\_p <- 1.0

p\_inv ~ dnBeta( alpha\_p, beta\_p )

Modeling Rate Variation Across Sites Proportion of Invariable Sites

alpha\_p <- 1.0 beta\_p <- 1.0

p\_inv ~ dnBeta( alpha\_p, beta\_p )

Modeling Rate Variation Across Sites
Proportion of Invariable Sites

alpha\_p <- 1.0 beta\_p <- 1.0

p\_inv ~ dnBeta( alpha\_p, beta\_p )

seq ~ dnPhyloCTMC(tree=psi, Q=Q, plnv=p\_inv, type="DNA")

Can also add + I to any "standard" model of sequence evolution.
